View Self Assessment Account API

API type	REST
Latest version	1.0 - controlled beta
Last updated	17 February 2026
Sandbox base URL	https://test-api.service.hmrc.gov.uk
Production base URL	https://api.service.hmrc.gov.uk

Overview

View Self Assessment Account exists to reduce misallocated payments. It provides information associated with a taxpayer's *Self Assessment* account for up to a maximum of 6+1 tax years in the past.

This read-only API allows developers to retrieve the following information:

- refunds
- payments
- penalties
- current position

The [View Self Assessment Account API Service Guide](#) contains further information on integrating with this API.

Errors

We use standard HTTP status codes to show whether an API request succeeded or not. They are usually in the range:

- 200 to 299 if it succeeded, including code 202 if it was accepted by an API that needs to wait for further action
- 400 to 499 if it failed because of a client error by your application
- 500 to 599 if it failed because of an error on our server

Errors specific to each API are shown in the Endpoints section, under Response. See our [reference guide](#) for more on errors.

Testing

API testing is performed in the [HMRC developer hub](#) “sandbox” environment. Once you’ve [registered for an account](#) you can conduct your own testing. The *View Self Assessment Account* API belongs to the “Self Assessment” category.

Work through the instructions on the [getting started](#) page to create an application, then locate and subscribe to the following APIs:

- **Create Test User**
- **View Self Assessment Account**

Before sending a GET request to the *View Self Assessment Account* API:

- [Create a test user](#) with a *View Self Assessment Account* subscription.
- Create a bearer token for the test user.

A GET request can then be sent using:

- A (required) UTR. The UTR can be obtained when creating a test user via the “saUtr” value in a successful response.
- An (optional) fromDate. The fromDate has the form YYYY-MM-DD. Omitting the fromDate will use the default time period of the current and previous tax years.

Versioning

When an API changes in a way that is backwards-incompatible, we increase the version number of the API. See our [reference guide](#) for more on versioning.

Endpoints

Version	Environments	Endpoints
Version 1.0 - beta (opens in new tab)	Sandbox	Request access
